A Proven Intervention

Even with excellent classroom instruction approximately 20% of students will have difficulty learning to read. Early intervention and powerful, accelerated instruction are essential in helping students who struggle the most in learning to read and write. Highly-trained Reading Recovery teachers work with students an average of 12-20 weeks in daily, one-to-one, 30 minute sessions.

Reading Recovery serves as part of a comprehensive approach for the lowest achieving children and is supplemental to good classroom instruction. During this intervention, approximately 80% of students who receive a full series of lessons make accelerated progress, catch up with their peers, and obtain the ability to work independently within an average group setting within the classroom. Reading Recovery also serves as a pre-referral program for the small number of students who need longer-term support.

In 2017, Reading Recovery intervention research was reviewed in the What Works Clearinghouse beginning reading category. Reading Recovery received strong ratings across all four domains – alphabetics, fluency, comprehension, and general reading achievement. In the beginning reading category, Reading Recovery’s rank for general reading achievement is the highest to date for any program reviewed. Reading Recovery® at Emporia State

Under the direction of the Emporia State University Training Center, multiple Kansas school systems, teachers, and children were served during the 2016-17 academic year. Reading Recovery was implemented in 34 systems, including 57 elementary schools in Kansas. A total of 612 students received individualized lessons through the instruction of 77 highly trained Reading Recovery teachers. Six teacher leaders provided quality professional development for Reading Recovery teachers and also tutored children.

Reading Recovery training is conducted each year. During the 2016-17 academic year, eight new Reading Recovery teachers completed the required seven graduate hours of study through ESU. All eight were trained through the generosity of an Emporia State University scholarship through the Jones Institute for Educational Excellence. Four teachers were trained at Garnett Elementary and four teachers were trained at the Topeka site. All eight certified teachers involved in the Reading Recovery training worked with individual children while engaging in intense theoretical understanding of literacy.

Program History

The work of developmental psychologist Marie M. Clay yielded a set of research-based procedures found to reverse the cycle of failure for most children in a relatively short period of time. The early intervention was developed in New Zealand in the mid-1970s. Since then the program has expanded to the United States, Australia, Canada, Denmark, Ireland, and the United Kingdom. Reading Recovery was established at The Ohio State University in 1984 and at Emporia State University in 1998. Reading Recovery has since expanded to include implementation in 42 states and the Department of Defense Schools (DoDDs), which serve the children of United States military families abroad. To date, Reading Recovery has served over two million students nationally.

In the US, there are 17 universities training Reading Recovery teacher leaders and 220 sites training Reading Recovery teachers. Nearly 4,863 teachers in more than 3,190 schools are involved in Reading Recovery in 42 states. During the 2016-17 academic year, 38,448 students had Reading Recovery and 504 had Descubriendo la Lectura lessons. Outcome data for all students were collected and reported to the International Data Evaluation Center.

Outcomes

Reading Recovery collects data for all children served, regardless of the number of lessons they received. Because the goal is successful grade level performance, children’s lessons are ended as soon as there is evidence they can progress in classroom literacy instruction without further one-to-one help. Rigorous criteria are applied to ensure students are independent in their literacy processing skills before their lessons are ended.

In the 2016-17 school year, out of the total number of children served (582) under the Emporia State University Training Center, 52% successfully completed their lesson series, reaching the average level of their classrooms in reading and writing. Seventeen percent were recommended for further specialist help after an intervention of 12-20 weeks; 20% were in Reading Recovery at the end of the school year with insufficient time to complete a full 20-week intervention; 2% moved while being served; and 9% were classified as none of the above (see Figure 1). The average length of a successful series of lessons was 15 weeks, less than 40 hours of actual instruction.

Of Kansas children who had an opportunity to receive a full series of lessons, 76% (304 students) successfully completed the lesson series and reached grade-level proficiency. This means 76% of the lowest achieving first grade students reached at least average reading levels of their peers after 12-20 weeks of instruction (see Figure 2). Kansas students entering Reading Recovery intervention at the beginning of the 2016-17 school year were reading at 4.0 levels lower than the state random sample average. The Reading Recovery students gained an average of 19 reading levels by the end of the school year, which is evidence of accelerated literacy growth.

“Reading Recovery is a great program and has helped my child go from not reading at all to [reading] above his grade level.”

Literacy Gains

Reading Recovery students who complete the intervention make dramatic changes in reading group placements across the school year as reported by their teachers (see Figure 3). In the fall, 41% of students who received a complete intervention were considered well below average in reading performance by their classroom teachers compared to 2% at year-end. Classroom teachers considered 83% of these students to be average to above average in their reading performance at year-end.

Reading Recovery demonstrates it can help close the literacy gap between higher achieving students and those who struggle to learn to read and write (see Figure 4). This is noteworthy when schools are looking for programs to ensure all students meet the federally mandated literacy goals. It is necessary for students who struggle the most to be brought up to class averages at an accelerated rate so they may continue to benefit from classroom instruction.

One-to-One Instruction & Beyond

Reading Recovery teachers receive intensive, high-quality training to teach children having the most difficulty learning to read and write. Once trained, the teachers use their knowledge and skills to work with four first-grade students daily, as well as work with other students during daily teaching assignments. Reading Recovery teachers work with an average of 50 students per year through their roles as classroom teachers, Title 1, reading specialists, ESL teachers, special education teachers or staff developers.

Kansas College and Career Ready Standards

Reading Recovery helps schools meet the Kansas College and Career Ready Standards by scaffolding for teachers and parents a shared understanding of what students are expected to learn regardless of where they live. Because of its effectiveness as an early intervention, Reading Recovery can play a vital role in ensuring students are able to meet the goals of the standards and are proficient in literacy by the end of high school. With this purpose in mind, Reading Recovery empowers students to achieve the knowledge and skill necessary for their future success.

“We have had great success. It has been fun to watch the students grow.”

Reading Recovery® and MTSS

Reading Recovery is a major component of a comprehensive literacy plan. The Kansas response to intervention, Multi-Tier System of Supports (MTSS), is a concept that believes in the success of all students. Success is the result of (1) prevention, (2) implementation of evidence-based interventions, and (3) progress monitoring. Through the Observation Survey, Reading Recovery systematically assesses the needs and strengths of individual students. Once the students who are most in need are selected, a series of individual lessons are implemented over a span of 12-20 weeks. Efficient and designed for individual students, Reading Recovery is an intervention that prevents literacy failure. Research has validated the effectiveness of Reading Recovery through more than 30 years of implementation in the United States and exemplary ratings from the US Department of Education's What Works Clearinghouse. Each student is monitored daily through a running record analysis and lesson records. Teachers make ongoing instructional decisions based on observations and analysis in order for the student to achieve accelerated learning.

Prevention & Cost Effectiveness

The potential reduction of referrals and placements in special education is one of the cost benefits of the Reading Recovery intervention. Reading Recovery serves the lowest literacy achievers in first grade and prevents further problematic strategic literacy behavior. The goal is successful grade level performance; the majority of students achieve this goal.

In 2016-17, 94% of students who successfully completed their Reading Recovery lesson series were not referred for special education. Only eight (3%) Kansas students who successfully completed their series of Reading Recovery lessons were referred and placed in special education. Of these eight students, only one was placed for reading. Five students (2%) await special education screening. Without the Reading Recovery intervention, many more students would have been referred and placed in special education services. The potential savings are enormous given the high cost of special education services. Prevention not only saves in educational funding, prevention, most importantly, promotes success and contributes to sustained gains in literacy.

Reaching More Students: Expert Literacy Training

Special education teachers may enroll in Reading Recovery year-long training in order to extend the benefits of Reading Recovery to a larger population of students. “It is because these procedures are designed for adapting the instruction to the learning needs of individual children that they can be applied to many beginning readers who are in some kind of special education” (Clay, 2005). Reading Recovery training is available for all certified educators interested in understanding reading and writing processes, systematic observation, and helping students who have extreme difficulty in learning how to read and write. Please contact a teacher leader or the director for more information.
